ABOUT
PANTHERA SOLUTIONS

PANTHERA SOLUTIONS

ABOUT US

01

Panthera Solutions – based in the Principality of Monaco – is an advisory company offering independent analyses for professional investors, based on sound proprietary research and methodologies.

OUR SERVICES

02

We offer strategic asset allocation intelligence and investment process optimization for the management of multi-asset-portfolios. Our solutions are based on third generation asset allocation principles, reasoned by applied behavioral finance.

We are a team of internationally renowned specialists in different fields. Our assignments and publications have proven us to be innovation leaders in Europe.

ABOUT
THE FOUNDER

- 15+Y Investment Banking
- Adjunct Professor
- Book Author
- Keynote Speaker
- Monaco Trusted Advisor

"Let me thank you for your excellent keynote speech on "Third Generation Asset Allocation", which I utmost enjoyed. It received strongly positive feedback from the audience and was definitely one of the highlights of the conference."

Prof. Mag. Otto Lucius, EFA®, CFP®, President of the Austrian Association of Financial Planners, organizer of the FINANZPLANER FORUM ´14

KEYNOTE SAMPLES

MARKUS SCHULLER

Markus Schuller has 15+ years experience in trading, structuring and managing standard and alternative investment products. Prior to Panthera Solutions, Markus worked in executive roles for a Long/Short Equity Hedge Fund for which he developed the trading algorithm. He was one of the first in Europe to fit hedge fund strategies into UCITS III – compliant structures. Markus started his career by working for renowned banks as Equity/Derivatives Trader and Macro Analyst. Markus founded Panthera Solutions in 2009 in the Principality of Monaco, using his extensive sell-side know how for now advising professional investors. He is a regular speaker at international investment conferences on Asset Allocation and Risk Management topics. Markus acts as a regular commentary contributor to German/Austrian/Swiss quality media as financial markets expert. His co-authored book "Portfoliomanagement in Unternehmen" (Springer Verlag, 2014) received strong review scores beyond the investment community. His OECD Insights articles are regularly cited in international publications. Since 2009 Markus teaches the courses „Portfolio Theory & Alternative Assets" and „Investment Banking" at the International University of Monaco, the latter also at the Danube University in Austria.

TRADITIONAL ASSET ALLOCATION
THE TRIUMVIRATE
CAPITAL ASSET PRICING MODEL

CAPM

CAPM is an equilibrium model.

Are expected return and real return in balance?

It is categorized as single-factor model as the SML-slope only depends on one risk parameter - BETA.

It is still heavily used in corporate finance and expected return estimations.

CAPM does not indicate a price, only a risk/return profile.
CAPM

$$E(r) = r_f + \beta \left(r_m - r_f \right)$$

CAPM

VALUE AT RISK

VALUE AT RISK

VaR answers the question: „How much can I lose?"

Value at Risk represents the maximum loss, given a certain holding period and a confidence interval.

VaR was introduced early 1990s and increased its dominance ever since:

- Group of Thirty „Derivatives: Practices and Principles"
- J.P. Morgan Risk Metrics^{TM}

VALUE AT RISK
EXCURSION – CONFIDENCE INTERVAL
VALUE AT RISK
CALCULATION METHOD
HISTORICAL SIMULATION

Distribution of Daily Returns
NASDAQ 100 - Ticker: QQQ

The worst 5% of daily returns are -4% to -8%
VALUE AT RISK
CALCULATION METHOD
HISTORICAL SIMULATION

Pros

- Intuitive
- No assumption on return distribution required
- Applicable for non-linear instruments

Cons

- Portfolio can change over time
- Last 100d might be non-representative
- All portfolio instruments require daily re-valuation

VALUE AT RISK
CALCULATION METHOD
VAR-COVAR

Assumes normal distribution of returns.

Requires assumptions on E(r) and SD of a security.

Distribution of Daily Returns
NASDAQ 100 - Ticker: QQQ
Example (QQQ)

The advantage of a normal distribution is to automatically know where to find the worst 1% or 5% of daily returns. Namely at z-scores of 2,33, respectively 1,65.

Confidence	# of Standard Deviations (σ)
95% (high)	- 1.65 × σ
99% (really high)	- 2.33 × σ

SD of QQQ during observation period at 2,64%.

Confidence	# of σ	Calculation	Equals:
95% (high)	- 1.65 × σ	- 1.65 × (2.64%) =	- 4.36%
99% (really high)	- 2.33 × σ	- 2.33× (2.64%) =	- 6.16%

	(rote/dunkle) Fläche (1-a)									
	0,65	0,7	0,75	0,8	0,85	0,9	0,95	0,975	0,99	0,995
z-Wert	0,385	0,524	0,674	0,842	1,036	1,282	1,645	1,960	2,326	2,576

VALUE AT RISK
CALCULATION METHOD
VAR-COVAR

PROS

- Simple calculation
- Risk Metrics has been improved significantly since – optionalities/ return assumptions

CONS

- Problems with non-linearity or return distributions beyond normal
- Assumption of static variance and covariance

VALUE AT RISK
CALCULATION METHOD
MONTE CARLO SIMULATION

PROS

- Flexible approach
- Any distribution can be assumed
- High number of scenarios can be created

CONS

- Garbage in – Garbage out!
- Significant computer power needed

VALUE AT RISK
ADVANCED VERSIONS

Conditional Value at Risk | CVaR

Das Conditional Value at Risk (CVaR), auch als Expected Shortfall (ES) bzw. Expected Tail Loss (ETL) bezeichnet , wird immer häufiger als Alternative zum VaR angewandt.

Der CVaR gibt an, welche Abweichung bei Eintritt des Extremfalls, d.h. bei Überschreitung des VaR, zu erwarten ist.

Modified Value at Risk | MVaR

Um die Schwäche des VaR (Var/Kov) Modells, nämlich der Annahme einer Normalverteilung, zu eliminieren, basiert das MVaR auf keiner speziellen Verteilung, sondern auf einer non-parametrischen Schätzung des historischen VaR.

Hierzu wir die Cornish-Fisher-Methode (nach E. A. Cornish and Ronald Aylmer Fisher) verwendet.

2GEN METHOD
MULTIPLE REGRESSION ANALYSIS

2GEN METHOD
ARCH-GARCH MODELS

The **random walk hypothesis** follows the assumption that stock prices move randomly over time. As a consequence, they cannot be predicted (confirming EMH).

Originally mentioned by Jules Regnault (1863) and academically postulated by Louis Bachelier ("The Theory of Speculation", 1900). Paul Cootner, MIT Professor, confirmed the assumption in 1964 in his publication: "The Random Character of Stock Market Prices."

The RWH celebrated a breakthrough in1973 thanks to Princeton Professor Burton Malkiel´s famous book: "**A Random Walk Down Wall Street**".

Infobox: BEHAVIOURAL FINANCE

BF marked a RWT counter-movement – see Andrew Lo´s „A NON-RANDOM WALK DOWN WALL STREET"
2GEN METHOD
ARCH-GARCH MODELS

HETEROSKEDASTICITY

= changing dispersion to trend-line in a time series (weather)

ARCH = AutoRegressive Conditional Heteroskedasticity
(Engle, 1982, Nobel Price)
HOMOSKEDASTICITY

= constant dispersion to trend-line in a time series

GARCH = Generalized AutorRegressive Conditional Heteroskedasticity (Bollerslev, 1986)

December 19, 2012

Abstract:
This paper examines the illiquidity premium in stock markets in 45 countries. The premium is the excess return on high-illiquidity stocks minus low-illiquidity stocks across volatility portfolios, after controlling for volatility.

The average monthly premium is 0.95% (0.44%) for equally-weighted (value-weighted) portfolio return. After controlling for six common global and regional risk factors, **the monthly alpha is 1.04% (0.54%).**

The **premium is much higher for emerging markets** than it is for developed ones and it is lower in countries with better disclosure and legal\governance rules. We document significant comovement of country illiquidity premium with both the global and regional average illiquidity premiums.

In June 2009 Yale´s Investment Committee voted for a significant SAA change:

❖ „The Committee approved an increase in the private equity target from **21 percent to 26 percent** to accommodate anticipated growth in private equity."

❖ "For similar reasons, the University increased the **real assets allocation from 29 percent to 37 percent exposure**."

❖ "The increases in the illiquid asset classes were funded by a 6 percentage point decrease in the absolute return target allocation to 15 percent, a 5 percentage point decrease in the foreign equity target allocation to 10 percent, and a 2.5 percentage."

2013 Yale Endowment Report
Warning not to copy Yale if you don´t have the capacities

"Few institutions and even fewer individuals exhibit the ability and commit the resources to produce risk-adjusted excess returns.

"… No middle ground exists. Low-cost passive strategies suit the overwhelming number of individual and institutional investors without the time, resources, and ability to make high-quality active management decisions. The framework of the Yale model applies to only a small number of investors with the resources and temperament to pursue the grail of risk-adjusted excess returns."

1

Benoit Mandelbrot - "Misbehaviour of Markets", 2004

"Theory suggests over that time [1916-2002], there should be fifty-eight days when the Dow moved more than 3.4 percent; in fact, there were 1'001. Theory predicts six days of index swings beyond 4.5 percent; in fact three were 366. And index swings of more than 7 percent should come once every 300'000 years; in fact, the twentieth century saw forty-eight such days."

Mandelbrot Makes Sense: A Book Review Essay

A discussion of Benoit Mandelbrot's *The (Mis)Behavior of Markets* by Nassim Nicholas Taleb

I closed this book feeling that it was the first book in economics that spoke directly to me. Not only that, but the astonishing simplicity, realism, and relevance of the subject makes it the *only* general work in finance I've ever read that seemed to *make sense.*

DECONSTRUCTION OF MYTHS
MYTH A – NORMAL DISTRIBUTION OF RETURNS

Nassim Taleb

Learning to Love Volatility

In a world that constantly throws big, unexpected events our way, we must learn to benefit from disorder, writes Nassim Nicholas Taleb.

„We never see black swans coming, but when they do arrive, they profoundly shape our world: Think of World War I, 9/11, the Internet, the rise of Google, …

Some made the mistake of thinking that I hoped to see us develop better methods for predicting black swans. Others asked if we should just give up and throw our hands in the air: If we could not measure the risks of potential blowups, what were we to do?

The answer is simple: We should try to create institutions that won't fall apart when we encounter black swans—or that might even gain from these unexpected events."

The "Great Confusion" concerning MPT

Markowitz, Harry

Other measures of risk

The results of Markowitz (2012a) raise the question: Could an approximation based on a different risk-measure have done better? This is the topic of Markowitz (2013) which considers the following risk-measures

Variance (V)
Mean Absolute Deviation (MAD)
Semivariance (SV)
Value at Risk (VaR)
Conditional Value at Risk (CVaR)

MYTH
VaR BASED RISK MANAGEMENT

4

David Einhorn (HF Manager, Greenlight Cap)

"VaR is like an Airbag that works all the time, except when you have a car accident."

Nassim Taleb

"VaR ignores 2500 years of experience in favor of untested models built by non-traders. It claims to estimate the risk of rare events, which is impossible. As such it gave false confidence."

Joe Nocera (NYT)

"VaR was very useful to risk experts, but nevertheless exacerbated the crisis by giving false security to bank executives and regulators. It is easy to misunderstand and dangerous when being misunderstood."

KILLING VaR

Killing VaR

Joseph Cotterill Author alerts ⌄ | May 03 2012 18:40 | Share

Hopefully that headline gets your attention for the Basel Committee on Banking Supervision's latest review of capital rules for banks' trading books.

There is a lot in it — the Committee has been tinkering with trading books since the crisis exposed serious mismatches between the capital that banks' models said they needed for trading structured credit, and the losses they ended up experiencing. In fact this review follows up on the 2009 rule-set dubbed 'Basel 2.5'.

But the VaR-killing idea is here:

> A number of weaknesses have been identified with using value-at-risk (VaR) for determining regulatory capital requirements, including its inability to capture "tail risk". For this reason, the Committee has considered alternative risk metrics, in particular **expected shortfall (ES). ES measures the riskiness of a position by considering both the size and the likelihood of losses above a certain confidence level. In other words, it is the expected value of those losses beyond a given confidence level.** The Committee recognises that moving to ES could entail certain operational challenges; nonetheless it believes that these are outweighed by the benefits of replacing VaR with a measure that better captures tail risk. Accordingly, the Committee is proposing the use of ES for the internal models-based approach and also intends to determine risk weights for the standardised approach using an ES methodology.

SHORT-TERM-ISM IN CAPITAL MARKETS

A recent research study on UK pension funds found that in 2008 the pensions would typically give underperforming managers 20 months to recover from their poor performance before firing them. These days the window has dropped to just 12 months. The long-term is becoming shorter and shorter all the time.

ON MARKET TIMING

HOW WELL DO MARKET PREDICTIONS WORK?

The best and most comprehensive study of expert judgment was performed by Philip Tetlock. In 1985 Tetlock, fascinated by his previous experience serving on political intelligence committees in the early 1980s, set out to discover just how accurate expert forecasters were in their predictions of future events. Over a span of almost 20 years, he interviewed 284 experts about their level of confidence that a certain outcome would come to pass. Forecasts were solicited across a wide variety of domains, including economics, politics, climate, military strategy, financial markets, legal opinions, and other complex domains with uncertain outcomes. In all, Tetlock accumulated an astounding 82,000 forecasts.

This represents an incredible body of evidence about expert judgment, and Tetlock's analysis rendered several astounding conclusions:

- Expert forecasts were less well calibrated than one would expect from random guesses
- Aggregated forecasts were better than any individual forecasts, but were still worse than random guesses
- Experts who appeared in the media most regularly were the least accurate
- Experts with the most extreme views were also the least accurate
- Experts exhibited higher forecast calibration outside of their field of expertise
- Among all 284 experts, not one demonstrated forecast accuracy beyond random guesses

In short, experts would have delivered better forecasts by flipping coins. But there was a silver lining.

ON MARKET TIMING

HOW WELL DO MARKET PREDICTIONS WORK?

William Sherden, "The Fortune Sellers", Wiley, 1998

Sherden reviewed the leading research and forecasting accuracy from 1979 to 1995 and forecasts made from 1970 to 1995. He concluded:

❖ Economists cannot predict the turning points in the economy. **Of the 48 predictions made by economists, 46 missed the turning points.**

❖ Economists´ forecasting skill is about as good as guessing. For example, even the economists who directly or indirectly run the economy, the Fed, the Council of Economic Advisors and the CBO, had forecasting records that were worse than pure chance.

❖ There are no economic forecasters who consistently lead the pack in forecasting accuracy.

❖ There are no economic ideologies whose adherents produce consistently superior economic forecasts.

❖ **Increased sophistication provides no improvement in economic forecasting accuracy.**

❖ Consensus forecasts offer little improvement

❖ Forecasts may be affected by psychological bias. Some economists are perpetually optimistic and others perpetually pessimistic

ON MARKET TIMING

Michael McCracken, "How Accurate are forecasts in a recession", Federal Reserve Bank of St Louis, 2009

He provided further evidence on the failure of economic forecasts to get it right when it is most important. He reviewed 26y of quarterly, one-year-ahead mean SPF forecasts from Q3/1981 until Q3/2007. He found that forecaster errors were 4x larger when the economy was in recession than when it was not.

Stephen Gould, "Full House", Harmony, 1996

Probably more intellectual energy has been invested in discovering (and exploiting) trends in the stock market than in any other subject – for the obvious reason that stakes are so high, as measured in the currency of our culture. **The fact that no one has ever come close to finding a consistent way to beat the system – despite intense efforts by some of the smartest people in the world – probably indicates that such causal trends do not exist, and that sequences are effectively random.**

ON MARKET TIMING

10 things economists won't tell you

1. "We can't predict the next crisis…"

2. "…but we may help cause it."

3. "We're not above a little guesswork."

4. "Those bold predictions? Blame the testosterone."

5. "Our measures of prosperity don't work."

6. "Ours is a dismal science, but not an exact one."

7. "We lean to the left."

8. "We might have an agenda."

9. "We may as well be speaking Klingon."

10. "We sell you what you already know."

EVALUATION REPORT

IMF Forecasts
Process, Quality, and Country Perspectives

(...) that the accuracy of IMF short-term forecasts is comparable to that of private forecasts. Both tend to overpredict GDP growth significantly during regional or global recessions, as well as during crises in individual countries" (IMF 2014)

Last updated: February 11, 2014 5:58 pm

OECD admits to forecasting errors during eurozone crisis

By Chris Giles in London

The OECD has admitted that its repeatedly false assumption that governments would take effective steps to ease the eurozone crisis was to blame for the international organisation's overly optimistic forecasts, not the impact of austerity.

The findings from the Organisation for Economic Cooperation and Development's postmortem exercise on its forecasting record lie in stark contrast to those of the International Monetary Fund, which said controversially in 2012 that all forecasters had underestimated the effect of austerity on the recovery – known as fiscal multipliers.

More

ON THIS TOPIC

John Kay Pisa tests lean in the right direction

Health spending hit since global crisis

UK a star performer amid OECD gloom

Pier Carlo Padoan, the OECD's chief economist, rejected that view on Tuesday, in findings that will bolster Germany and other governments that have always said fiscal consolidation was a necessary part of the response to the crisis, rather than a mistake that consigned millions to unemployment and poverty.

"The OECD did not underestimate fiscal multipliers," he said. "It was the repeated assumption that the euro crisis would dissipate over time, and that sovereign bond yield differentials would narrow, they turned out to have been the most important source of error."

ON MARKET TIMING

From three sources
– Consensus Economics ("private sector forecasts")
– IMF's World Economic Outlook (WEO)
– OECD's Economic Outlook

• Statistical photo-finish:

 • Consensus, WEO and OECD forecasts are virtually identical

• Ability to predict recessions

  • **Fail Again:** *Economists were not able to predict too many recessions over this period, particularly in advance. Generally, recessions arrived before they were forecast*

  • **Fail Better:** *though recessions occurring in 2009 were not predicted a year in advance, the number of recessions was actually over-predicted over the course of 2009. Herman Stekler would argue that this is progress because in the past economists have been too timid about calling recessions.*

The Whitney Show | An analyst's calls won her fame, but not all have proved correct

Oct. 31, 2007 — As a managing director at Oppenheimer & Co., Ms. Whitney downgrades Citigroup Inc. and predicts the bank will have to raise capital, sell assets or cut its dividend. What happened: Days later, Citigroup CEO Charles Prince resigned. Three months later, the dividend was cut, winning Ms. Whitney wide acclaim.

Nov. 10, 2008 — Ms. Whitney, after warning for more than a year that banks were in dire shape, tells The Wall Street Journal: "The fourth quarter will be massively disruptive" and U.S. unemployment will top 8% by 2009. What happened: The fourth quarter continued to be troubled and unemployment hit 10% in 2009.

Dec. 19, 2010 — Ms. Whitney tells "60 Minutes" that a wave of debt defaults by cities and states is on the way. What happened: Municipal bonds weaken but just a handful of municipalities run into serious problems.

June 4, 2013 — Ms. Whitney's new book, "Fate of the States" predicts the central U.S. will prosper, while the coasts struggle. What will happen: Too soon to tell.
WSJ research

Meredith Whitney, shown during an April interview on Bloomberg Television, opened a research firm in early 2009.

BUT SOME TRY AND TRY ..

Figure 2. Most popular metrics have had little or no correlation with future stock returns

Proportion of variance of future real stock returns that is explained by various metrics, 1926-2011
Forecasting stock returns:
What signals matter,
and what do they say now?

Vanguard research   October 2012

We expand on previous Vanguard research in using US stock returns since 1926 to assess the predictive power of more than a dozen metrics that investors would know ahead of time. We find that many commonly cited signals have had very weak and erratic correlations with actual subsequent returns, even at long investment horizons. These poor predictors include trailing values for dividend yields and economic growth, the difference between the stock market's earnings yield and Treasury bond yields (the so-called Fed Model), profit margins, and past stock returns.

Commonly used ratios hardly provide forecasting accuracy

Mark Carhard, "On Persistence in Mutual Fund Performance," Journal of Finance, March 1997

Carhard Conclusions:
There **was no persistence in performance beyond what would be randomly expected** – the past performance of active managers is a poor predictor of their future performance.

Expenses both reduce returns on a one-for-one basis and explain much of the persistent long-term under-performance of mutual funds Turnover reduces pretax returns by almost 1% of the value of trade

Mark Carhart, Jennifer Carpenter, "Mutual Fund Survivorship," Review of Fin. Studies, 2002

Analyzed the performance of **2071 equity funds for the period 1962-1995.** They found that the average actively managed mutual fund underperformed its appropriate passive benchmark on a pretax basis by **about 1.8% per annum**.

MUTUAL FUNDS

Christopher Philips, Francis Kinnery, "Mutual Fund Ratings and Future Performance", Vanguard Institute, Feb10

They examined the excess returns over the 3y period following a given rating. They chose the 3y rating period because Morningstar requires at least 3y of performance data to generate a rating and investment committees typically use a 3y window to evaluate the perf of their managers. Period covered was June 30, 1992 through August 31, 2009. Their summary:

- ❖ 39% of funds with 5* ratings outperformed their style benchmarks for the 36 months following the rating, while 46% of 1* funds did.
- ❖ Most of the star-rating groups produced negative excess returns in the succeeding 3y. Even worse, the 4* and 5* figures were more negative than those of lower-rated groups.
- ❖ Higher ratings in no way ensure that an investor would increase his or her odds of outperforming a style benchmark in subsequent years.
Morningstar "FundInvestor", Nov2009

About its 5 star funds
- ❖ The 2004 class of 5* domestic funds had a five-year rating of just 3.2, just slightly above average. And, as we have seen. The average fund has **underperformed its risk adjusted benchmark by close to 2%.**
- ❖ The 2005 group of 5* funds had a 3y rating of just 3.1
- ❖ The 2006 group had a 3y rating of just 2.9

Marlena Lee, "Is there skill among active bond managers?", December 2009

Lee studied the performance of **2353 bond funds over the period 1991-2008**, which included investment grade, high-yield and gov bond funds. Her findings:

❖ Actively managed bond funds **underperformed by an amount roughly equal to fees**
❖ Expense ratios were a good predictor of performance
❖ Good past performance did not predict good future performance. There was **no evidence of positive after-cost expected alphas**, even n the top percentile of funds
❖ Underperformance of loser funds persisted for several years. Most of the persistence in loser returns could be attributed to fees.
❖ Collectively, investors in active bond funds lose about 90 bps per year.

The percentage of active funds that beat their benchmark index is pretty slim indeed. David Swensen agrees. "A miniscule 4% of funds produce market-beating after-tax results with a scant 0.6% (annual) margin of gain. The 96% of funds that fail to meet or beat the Vanguard 500 Index Fund lose by a wealth-destroying margin of 4.8% per annum." (Bogle, 2007)

SWENSEN agrees

Outperformance, Underperformance and Mutual Fund Flows in up and down Markets

Aron A. Gottesman
Pace University - Lubin School of Business - Department of Finance and Economics

Matthew R. Morey
Pace University - Lubin School of Business - Department of Finance and Economics

Menahem Rosenberg
Pace University

January 5, 2013

Abstract:
In this paper we examine how the relationship between mutual fund benchmark returns and subsequent net annual flows differs in up and down markets.

We also find that that funds that underperform their benchmark index in down markets have significantly less net flows than similarly underperforming funds do in up markets.

In down markets the incentive for active mutual fund managers is to closet index as the benefits of outperforming the benchmark in terms of net flows are low and the costs of underperforming the benchmark in terms of net flows are high.

Conversely, active management makes more sense in up markets as the
benefits of outperforming the benchmark in terms of net flows are large and the costs of underperforming the benchmark in terms of net flows are relatively low.

Numerous studies show that funds which are truly actively managed and more concentrated outperform indices and do so with persistence. See, e.g., Kacperczyk, Sialm & Zheng, "Unobserved Actions of Mutual Funds" (2005); Cohen, Polk & Silli, "Best Ideas" (2010); Wermers, "Is Money Really 'Smart'? New Evidence on the Relation Between Mutual Fund Flows, Manager Behavior, and Performance Persistence" (2003); Brands, Brown & Gallagher, "Portfolio Concentration and Investment Manager Performance" (2005); and Cremers & Petajisto, "How Active Is Your Fund Manager? A New Measure That Predicts Performance," (2007). As summarized by Cremers and Petajisto:

ACTIVE SHARE RULES - LITERATURE

"Funds with the highest Active Share [most active management] outperform their benchmarks both before and after expenses, while funds with the lowest Active Share underperform after expenses .... The best performers are concentrated stock pickers ....We also find strong evidence for performance persistence for the funds with the highest Active Share, even after controlling for momentum. From an investor's point of view, funds with the highest Active Share, smallest assets, and best one-year performance seem very attractive, outperforming their benchmarks by 6.5% per year net of fees and expenses."

Active Management Required

SMART MONEY   March 12, 2014 10:39 am

Active fund managers are closet index huggers

By John Authers   [Author alerts ⌄]

Study finds 'closet indexing' is rife in US active funds

How active is your fund manager, and what chance do they really have of beating the market?

These questions are linked. A crude measure of how much fund managers deviate from their benchmark can help predict which funds will outperform. That measure is "active share" – the percentage of a fund's portfolio that differs from its benchmark. Thus a well-managed index fund will have an active share of 0 and an esoteric fund that holds no stocks in its index has an active share of 100.

But it rams home a message all investors should understand. There is no eminent point in paying a small fee for a fund that merely matches an index (which need not be based on market capitalisations), or in spending good money to unleash an active manager to attempt to find performance, matched against an absolute return benchmark, and perhaps being allowed to use short selling or derivatives. There is little or no case for what lies in between – and that middle ground includes much of the traditional regulated fund management industry in the US.

STATING A PREFERENCE

The Nobel Prize winning creator of the Capital Asset Pricing Model takes another look at his work.

By Andrew Gluck

The Nobel Prize winning creator of the Capital Asset Pricing Model takes another look at his work.

Gluck: So then, what you're saying is we knew the CAPM system was imperfect. And now this is an effort to make it more real-world?

Sharpe: Yeah, that's fair. No theory will be fully real-world. There's no way you can bring all of the elements of the real world into a set of equations or a computer program and get it all in there. So the question is, at what point do you have enough of the real world in your theory or your computer program so that you're comfortable going ahead with the implications as a matter of how you run portfolios?

RISK FACTOR DIVERSIFICATION VS FACTOR BASED INVESTING

HOW TO ISOLATE RISK FACTORS?

RISK FACTOR DIVERSIFICATION

Box 2.2. A New Asset Allocation Framework Using Risk Factors

Some institutional investors are using a new method of asset allocation, described here.

Asset allocation based on risk factors is gaining recognition among institutional investors. After the financial crisis, some institutional investors started to group investments on the basis of their risk and return profiles rather than according to traditional asset classes such as equities, bonds, and alternative assets. By doing so, asset managers say they are seeking to better understand the risks they are taking and therefore to better manage portfolio risk.

One case in point is the "new alternative asset classification" of the California Public Employees' Retirement System (CalPERS), which became effective in July 2011. The new asset classification consists of five categories—income, growth, real, inflation-linked, and liquidity (see first table). Compared with the traditional classification, this approach provides more information about the risk exposures of the pension fund. The new classification has not immediately changed the overall asset allocation except that the target share of real estate in the portfolio is 3 percentage points higher, cash 2 percentage points higher, and fixed income assets 4 percentage points lower.

Another case of note is that of the Alaska Permanent Fund Corporation, which in 2009 moved away from traditional asset classifications to group its investments by their risk and return profiles (see second table). The fund did not change the long-term target of achieving a 5 percent real rate of return on the assets in which the fund invests, but it judged that the new classification could help it better understand the risk profile of its portfolio. For example, corporate bonds and stocks are grouped together, given that in adverse economic conditions they may perform similarly to each other. Under the

RISK FACTOR DIVERSIFICATION

…and the Cross-Section of Expected Returns

Campbell R. Harvey
Duke University - Fuqua School of Business; National Bureau of Economic Research (NBER)

Yan Liu
Texas A&M University, Department of Finance

Heqing Zhu
Duke University - Fuqua School of Business

February 3, 2015

Abstract:
Hundreds of papers and hundreds of factors attempt to explain the cross-section of expected returns. Given this extensive data mining, it does not make any economic or statistical sense to use the usual significance criteria for a newly discovered factor, e.g., a t-ratio greater than 2.0. However, what hurdle should be used for current research? Our paper introduces a multiple testing framework and provides a time series of historical significance cutoffs from the first empirical tests in 1967 to today. Our new method allows for correlation among the tests as well as publication bias. We also project forward 20 years assuming the rate of factor production remains similar to the experience of the last few years. The estimation of our model suggests that today a newly discovered factor needs to clear a much higher hurdle, with a t-ratio greater than 3.0. Echoing a recent disturbing conclusion in the medical literature, we argue that most claimed research findings in financial economics are likely false.

Long-Term Capital Budgeting

Yaron Levi
University of California, Los Angeles (UCLA) - Finance Area

Ivo Welch
University of California, Los Angeles (UCLA); National Bureau of Economic Research (NBER)

March 29, 2014

Abstract:
Our paper tests whether the expected rate-of-return estimates for long-term capital budgeting from the FFM and CAPM could outperform those from a simpler risk-neutral term-structure-based model. Our paper first estimates reasonable shrinkage (input parameters) based on historical data.

We find
1. Factor exposures drift(ed) significantly over longer horizons
2. Since 1970, the arithmetic (geometric) equity premium relative to long- term Treasuries has been only 1.7% (0.8%) per year. This decline was primarily due to higher long-term Treasury yields, not lower average stock returns.

DATA SNOOPING 1
Meta-Study on 315 Factors, collected in 312 publications of Top Tier Journals. Only between 2010-2012 literature came up with 59 (!) new factors.

DATA SNOOPING 2
Meta-Study on 600 (!) in popular science journals. In 49% of all factors, out-of-sample tests have shown NO or even NEGATIVE premia.

Factor Investing Revisited

David Blitz
Robeco Asset Management - Quantitative Strategies

July 3, 2015

Journal of Index Investing, Forthcoming

Abstract:
This paper takes another look at the recommendation of Blitz [2012] to allocate strategically to the value, momentum and low-volatility factor premiums in the equity market. Five years of fresh data shows that such a factor investing strategy continued to deliver out-of-sample. The potential added value of the two new factors in the Fama-French 5-factor model, operating profitability and investment, is investigated and found to depend critically on the performance metric that is considered most important. The paper also reviews the role of small-cap stocks, factor timing, long-only versus long-short portfolio construction, international evidence and factor investing beyond equities.

International Tests of a Five-Factor Asset Pricing Model

Eugene F. Fama
University of Chicago - Finance

Kenneth R. French
Dartmouth College - Tuck School of Business; National Bureau of Economic Research (NBER)

June 24, 2015

Abstract:
Average stock returns for North America, Europe, and Asia Pacific increase with the book-to-market ratio (B/M) and profitability and are negatively related to investment. These patterns are strong for small stocks but weaker for big stocks. For Japan the relation between average returns and B/M is strong in all Size groups, but average returns show little relation to profitability or investment. Especially for big stocks, a five-factor model that adds profitability and investment factors to the three-factor model of Fama and French (1993) largely absorbs the patterns in average returns. As in Fama and French (2015a,b), the model's prime problem is failure to capture fully the low average returns of small stocks whose returns behave like those of unprofitable firms that invest aggressively.

Abstract:

Risk-taking behavior is highly correlated between parents and their children; however, little is known about the extent to which these relationships are genetic or determined by environmental factors. We use data on stock market participation of Swedish adoptees and relate this to the investment behavior of both their biological and adoptive parents. We find that stock market participation of parents increases that of children by about 34% and that both pre-birth and post-birth factors are important. However, once we condition on having positive financial wealth, we find that nurture has a much stronger influence on risk-taking by children, and the evidence of a relationship between stock-holding of biological parents and their adoptive children becomes very weak. We find similar results when we study the share of financial wealth that is invested in stocks. This suggests that a substantial proportion of risk-attitudes and behavior is environmentally determined.

(Hypothesising After Results are Known)

SOLUTION Pre-Register

The best solution to this we've yet found is known as pre-registration: studies have to be registered in advance, and the hypotheses under investigation stated up front before the research is done.

Confirmation comes from repetition. Any attempt to avoid this statement leads to failure and more probably to destruction.

If we truly wanted to become better investors then we'd pre-register our hypotheses - including our expected timescales - and then measure our results against the results. Doubtless the outcome would frequently be embarrassing, but the evidence that we do have suggests that getting real feedback about our performance is the only way to improve predictive capability in complex systems like the stockmarket.

The other thing this would do would be to force us to face up to the reality that we can be successful by luck and can fail through no fault of our own. In complex adaptive systems we simply cannot predict every possible situation, we can only hope to be able to predict a little better than average. But a little better is enough to make a turn, so every percentage point improvement we can make is worth it.

**Replications in Psychology Research:
How Often Do They Really Occur?**

http://pps.sagepub.com/content/7/6/537.full.pdf+html

Matthew C. Makel[1], Jonathan A. Plucker[2], and Boyd Hegarty[3]
[1]Duke University, [2]University of Connecticut, and [3]University of New Hampshire

**OVERALL
REPLICATION RATE
1.07%**

Abstract
Recent controversies in psychology have spurred conversations about the nature and quality of psychological research. One topic receiving substantial attention is the role of replication in psychological science. Using the complete publication history of the 100 psychology journals with the highest 5-year impact factors, the current article provides an overview of replications in psychological research since 1900. This investigation revealed that roughly 1.6% of all psychology publications used the term *replication* in text. A more thorough analysis of 500 randomly selected articles revealed that only 68% of articles using the term *replication* were actual replications, resulting in an overall replication rate of 1.07%. Contrary to previous findings in other fields, this study found that the majority of replications in psychology journals reported similar findings to their original studies (i.e., they were successful replications). However, replications were significantly less likely to be successful when there was no overlap in authorship between the original and replicating articles. Moreover, despite numerous systemic biases, the rate at which replications are being published has increased in recent decades.

Warren Buffett on Active Vs Passive
(concepts learned from Benjamin Graham):

"The determining trait of the **enterprising [active] investor** is his willingness to devote time and care to the selection of securities that are both sound and more attractive than the average. Over many decades, an **enterprising investor of this sort could expect a worthwhile reward for his extra skill and effort** in the form of a better average return than that realized by the passive investor."

SOURCE

ESTABLISHING NEW RITUALS I
SKIN IN THE GAME / ENTERPRISING INVESTOR

Before diving head long into the new year I wanted to point out a a paper that came out last month. A paper by **Paul Woolley** and **Dimitri Vayanos** at the *London School of Economics* entitled "Taming the finance monster" attracted a fair bit of attention. In it they take to task the owners of capital for essentially putting up with the ongoing shenanigans of fund managers on their behalf. In addition to taking to task efficient markets they try to tackle the principal-agent problem in fund management.

This is surely an overlooked topic in finance. The separation of actual fund management from capital owners presents all sorts of issues. One could argue that market failures, broadly defined, occur because of the mismatch in incentives for the parties. Woolley and Vayanos write:

Agents have learnt that financial markets do not function like goods markets, and that the usual laws of competition do not apply under asymmetric information. Moral hazard, complexity and opacity all help them capture rents. They also benefit from mispricing, volatility and the proliferation of products. The costs and fees of intermediation go hand in hand with pricing inefficiencies in contributing to the erosion of the returns on savings.

From Central Banking Journal, December, 2012 Issue.

Taming the finance monster

The best way to resolve global financial instability is for the owners of capital to assert themselves, with sovereign funds well positioned to take the lead, say Paul Woolley and Dimitri Vayanos.

AVOID MULTI-TASKING

ESTABLISHING NEW RITUALS II ON THE AVOIDANCE OF MULTI-TASKING

There are at 4 different things we might mean when we talk about multitasking. These four practices — **multitasking, task switching, getting distracted and managing multiple projects** — all fit under the label "multitasking".

GENUINE MULTITASKING: patting your head while rubbing your stomach; playing the piano and singing; walking while chewing gum. Genuine multitasking is possible, but at least one of the tasks needs to be so practised as to be done without thinking.

NEUTRAL

RAPID TASK SWITCHING: an eye on email in case your boss wants you. This isn't multitasking in the same sense. A better term is task switching, as our attention flits between the presentation, the telephone and the inbox. A great deal of what we call multitasking is in fact **rapid task switching.**

AVOID

DEFINITION OF MULTI-TASKING

AVOID

DO

Task switching is often confused with a third, quite different activity — the guilty pleasure of disappearing down an unending click-hole of celebrity gossip and social media updates. There is a difference between the person who reads half a page of a journal article, then stops to write some notes about a possible future project, then returns to the article — and someone who reads half a page of a journal article before clicking on bikini pictures for the rest of the morning. What we're often calling multitasking is in **fact getting distracted.**

A final kind of multitasking isn't a way of getting things done but simply the condition of having a lot of things to do. aving a lot of things to do is not the same as doing them all at once. It's just life. And it is not necessarily a stumbling block to getting things done. = **managing multiple projects**

FEES & LOYALTY

Ritholtz Wealth Management Celebrates Second Anniversary with a Reward for its Clients

Investment advisory firm launches groundbreaking initiative to recognize the prudent behavior and long-term outlook of its customers

NEW YORK, Sept. 16, 2015 /PRNewswire/ — Ritholtz Wealth Management today announced its groundbreaking Milestone Rewards initiative, which reduces the management fees its clients pay based upon the length of time they remain committed to the firm's disciplined investment strategy. Milestone Rewards is being rolled as RWM celebrates its second anniversary.

Effective immediately, all Ritholtz Wealth Management clients are eligible for the lowered management fee upon the completion of their 36th month with the firm. This reduction in management fees will result in approximately 16% average annual savings for clients, according to internal calculations.

ESTABLISHING NEW RITUALS VII
AVOID CHRONIK OVERWORK

There's a large body of research that suggests that regardless of our reasons for working long hours, overwork does not help us. For starters, it doesn't seem to result in more output. In a study of consultants by Erin Reid, a professor at Boston University's Questrom School of Business, managers could not tell the difference between employees who actually worked 80 hours a week and those who just pretended to. While managers did penalize employees who were transparent about working less, Reid was not able to find any evidence that those employees actually accomplished less, or any sign that the overworking employees accomplished more.

Considerable evidence shows that overwork is not just neutral – it hurts us and the companies we work for. Numerous studies by Marianna Virtanen of the Finnish Institute of Occupational Health and her colleagues (as well as other studies) have found that overwork and the resulting stress can lead to all sorts of health problems, including impaired sleep, depression, heavy drinking, diabetes, impaired memory, and heart disease. Of course, those are bad on their own. But they're also terrible for a company's bottom line, showing up as absenteeism, turnover, and rising health insurance costs. Even the Scroogiest of employers, who cared nothing for his employees' well-being, should find strong evidence here that there are real, balance-sheet costs incurred when employees log crazy hours.

Harvard Business Review

ORGANIZATIONAL CULTURE

The Research Is Clear: Long Hours Backfire for People and for Companies

by Sarah Green Carmichael

AUGUST 19, 2015

[SOURCE](#)

Then there's the version that looks at our psychology. In this one, we log too many hours because of a mix of inner drivers, like ambition, machismo, greed, anxiety, guilt, enjoyment, pride, the pull of short-term rewards, a desire to prove we're important, or an overdeveloped sense of duty. Some of these are negative (see: guilt, anxiety) but many are positive. In fact, multiple researchers have actually found that work is *less* stressful than our home lives. For some, work can be a haven, a place to feel confident and in control.

Now, this is not to say we can never pull a long day. We just can't do it routinely. Most of the research suggests that people can put in a week or two of 60 hours to resolve a true crisis. But that's different from chronic overwork.

HEDGE FUNDS

BRIEF HISTORY *of* HEDGE FUNDS

Regulation of U.S. securities industry begins with the Securities Act of 1933. Regulation D exempts companies selling to "accredited investors" from registering.

Fortune magazine **publishes article on Alfred Winslow Jones' hedge fund** – number of hedge funds grows in the following years.

Alternative Investment Management Association (AIMA) formed to represent all practitioners in the alternative investment management industry.

SEC adopted rules requiring registered advisors with $150 million or more in AUM to report comprehensive fund information.

PERTRAC founded.

Regulation of U.S. funds begins with passage of the **Investment Company Act of 1940**.

European Federation of Investment Funds and Companies (FEFSI) established – later renamed **European Fund and Asset Management Association (EFAMA)**.

Financial Services Authority (FSA) established to regulate the UK financial services industry.

1933   1934   1940   1949   1966   1969   1974   1990   1991   1996   2001   2002   2011   2012

Securities Exchange Act of 1934 establishes the **Securities and Exchange Commission (SEC)**.

Rothschild Family introduces the world's **first fund of hedge funds**.

Managed Funds Association (MFA) is formed to advocate on behalf of hedge funds and managed futures firms.

Committee of European Securities Regulators (CESR) established – later replaced by the European Securities and Markets Authority (ESMA) in 2011.

JOBS Act passed. Allows hedge funds to market themselves to a broader audience.

Alfred Winslow Jones forms first hedge fund (coining them "hedged funds") and eventually introduces the 20% performance fee.

Commodity Futures Trading Commission (CFTC) established. Commodity Trading Advisors (CTAs), or commodity pools, are generally required to register with the CFTC.

Hedge Fund Association (HFA) founded to advocate on behalf of smaller and emerging hedge funds.

"UCITS III" Directives released in Europe allowing UCITS to employ alternative strategies.

HEDGE FUNDS

Keynes, the hedge fund pioneer

By Gavyn Davies

The macroeconomics of John Maynard Keynes continue to dominate the global economic policy debate to this very day. But many have forgotten that the great intellectual was also one of the most active investors of his era.

He made and lost several fortunes, for himself, his friends, his college (King's, Cambridge) and for City institutions which he chaired or founded. In some respects, he was an early hedge fund investor, first in macro in the 1920s, and then in equities in the 1930s. He ended as one of the most successful investors of the first half of the last century, but along the way he learnt many lessons which resonate to this day.

Macro Hedge Funds Stink at Market Timing

🕐 10/10/2012 3:34 PM 👤 SOBER LOOK 💬 1 COMMENT

By Walter Kurtz, Sober Look

In spite of improved hedge fund performance during Q3-2012, hedge funds with Macro strategy focus continued to struggle (as **discussed earlier**).

HedgeWeek: – Macro hedge funds detracted from industry wide gains on weakness in trend following and commodity exposures, with the HFRI Macro Index posting a decline of 0.26 per cent; the September decline was the second consecutive monthly decline for macro. Systematic macro funds posted declines on short exposures to equities and commodity metals, as the HFRI Macro: Systematic/CTA Index posted a decline of 0.9 per cent. Discretionary macro and currency focused strategies had positive contributions from positions concentrated in Dollar/Euro, global equities and short fixed income.

Their poor performance can be explained in one sentence: Macro hedge funds are terrible at timing financial markets. The chart below shows Macro hedge funds' positioning in equities over time. "1" means maximum long allocation to equities (on a net basis) and "-1" means maximum short allocation. These investment "professionals" missed the rally from late last year into early this year (in spite of **signs pointing to markets being oversold at the time**). They also missed the correction this spring and early summer (in spite of **signs pointing to froth** in the markets) and then again missed the ECB-induced rally.

Macro Hedge Funds' US Equity Positioning

Professional portfolio consultants dish on alternatives at the Milken Institute Global Conference.

LOS ANGELES -- Top portfolio consultants questioned the need for large allocations to hedge funds at Milken Institute Global Conference, saying only a fraction of the industry deserved the high fees they charge.

Lisa Shalett

Lisa Shalett, chief investment officer of Merrill Lynch Global Wealth Management, pointed out an inherent problem: hedge funds may pitch themselves as low-correlation investments, but they are paid on performance even if they simply mimic the markets. In other words, investors often pay dearly for beta.

"It's a massive misalignment of incentives," said Shalett, speaking on the "Diversifying Portfolio Risk Through Asset Allocation" panel Tuesday. "For...

Soros Says Hedge Funds Can't Beat Market Because of Fees

By Katherine Burton - Jan 25, 2013 8:25 PM GMT+0100

George Soros, the billionaire philanthropist and former hedge-fund manager, said institutions that invest in the industry should expect poor performance, in part because managers charge high fees.

🔍 Enlarge image

"Outperforming the market with low volatility on a consistent basis is an impossibility," said Soros. "I outperformed the market for 30-odd years, but not with low volatility." Photographer: Chris Ratcliffe/Bloomberg

0:47

Jan. 25 (Bloomberg) -- Soros Fund Founder and Chairman talks about the European economy from the World Economic Forum in Davos, Switzerland. (Source: Bloomberg)

"Since hedge funds are now a dominant force in the market, they can't, as a group, outperform the market," Soros said today in a Bloomberg Television interview with Erik Schatzker from the World Economic Forum in Davos, Switzerland. The funds' fees, typically 2 percent of assets and 20 percent of returns, eat into profits, Soros said.

Soros's hedge fund operated until 2011, when he turned New York-based Soros Fund Management LLC into a family office that now oversees $24 billion. He averaged returns of about 20 percent a year since 1969 at the firm and its predecessor.

Hedge-fund performance will also be impeded because managers and investors are reluctant to take risks, Soros said.

"Outperforming the market with low volatility on a consistent basis is an impossibility," said Soros, 82. "I outperformed the market for 30-odd years, but not with low volatility."

More Hedge Funds Close Up Shop as Returns Fizzle

Published: Friday, 2 Nov 2012 | 1:33 PM ET   ↑T Text Size [−] [+]

By: Reuters

Generating strong returns is getting so tough for hedge fund managers, supposedly the high-earning masters of any market, that some are shutting up shop and more look poised to follow.

LWA | Image Bank | Getty Images

Years of choppy markets whipsawed by political risk have crippled performance and left many firms with little in the way of income earned by hefty fees.

(*Read More:* **Track Stock Funds, Bond Funds, Money Market Funds and ETFs Here**)

Now, with an investor base increasingly ready to pull out, several are calling it quits.

Edoma Partners, one of the most talked about hedge fund launches since the financial crisis, said on Thursday it was closing just two years after it started, hit by poor performance and a flurry of investor redemptions.

Pierre Henri-Flamand, the ex-**Goldman Sachs** [GS 123.25 ▼ -1.60 (-1.28%) ⚡] trader turned founder, blamed "unprecedented market conditions".

Other, more veteran managers, have also decided to exit.

Greg Coffey, one of the industry's best known figures, decided to retire early and liquidate one of his funds at **Moore Capital**, sources said earlier this month.

That followed Driss Ben-Brahim's decision to retire from **GLG**, the hedge fund he joined in 2008 and now owned by **Man Group**.

"It's been too long that hedge funds haven't delivered what they promised," said one investor, asking not to be named.

HEDGE FUNDS
MYTH B – HIGHLY LEVERAGED
Source: Morgan Stanley Prime Brokerage.
Note: Leveraged defined as assets divided by equity capital. Cash balances as a percent of total assets.
Source: Credit Suisse, Beurteilung der De-leveraging-Risiken für Hedge-Fonds, 20 March 2008.

Hedge funds' leverage risk is low.

Hedge fund leverage is governed largely by private relationships with its prime brokers. A fund posts collateral with this prime broker to secure its trades and the broker uses its own risk matrix to determine how much to lend.

Small hedge funds hit by closures

By Ruth Sullivan

A rising number of small hedge funds are shutting their doors, with houses run by former investment bank proprietary traders being particularly badly hit by rising costs and difficulty in attracting assets.

The mounting burden of regulatory compliance is proving particularly damaging to smaller hedge funds, said Paula Smith, head of asset management at PwC in the UK, and previously PwC's alternatives investments assurance leader in the US.

Managers traded on Dell tips,

"People just can't afford to keep going if they don't have a certain level of assets. The SEC [Securities and Exchange Commission] forces hedge funds to have a chief compliance officer and lawyers and internal staff they may not have had in the past," she said.

Without the necessary infrastructure and assets, "the future in the US is the big guys will get bigger and the small guys...are really going to find it difficult to continue to bear the cost of technology [and personnel]," Ms Smith added.

Figures from Preqin, the alternatives data provider, show that 50 per cent of hedge funds that closed globally since January 2011 had less than $49m of assets under management.

U.S. SEC Gets Wave of Hedge Fund Adviser Registrations

By Reuters
Friday, October 19, 2012

Email this story | News Tracker | Reprints | Printable Version

WASHINGTON (Reuters)—More than 1,500 hedge fund and private equity funds have registered with the U.S. Securities and Exchange Commission since the 2010 Dodd-Frank Wall Street reform law was enacted.

The law for the first time required hedge fund and private equity funds to register with the SEC, giving the agency a better view of the size of the fund industry and the identity of those involved. Including the 2,557 private advisers who previously registered voluntarily, the SEC said on Friday [Oct. 19] it now has a total of 4,061 private fund advisers on file.

"Prior to the Dodd-Frank Act, regulators only saw a slice of the pie but didn't know how big the pie even was," said SEC Chairman Mary Schapiro in a statement. "The law enables regulators to better protect investors by providing a more comprehensive view of who's out there and what they're doing."

SEC examiners last week launched a new initiative to conduct risk-based exams of fund advisers over the next two years to ensure compliance with the law. Among the areas being examined include marketing materials, portfolio management, conflicts of interest, safety of client assets and valuation.

Although the SEC gained a lot of additional responsibility for overseeing private fund advisers from Dodd-Frank, the law also required oversight of mid-sized advisers to be shifted to the states.

The SEC said that 2,300 of these mid-sized advisers managing less than $100 million have made the transition to state regulation.

Heath Abshure, the Arkansas Securities Commissioner and president of the North American Securities Administrators Association, said in a statement that the switch has been "smooth" for the vast majority of advisers.

The agency also issued a notice identifying another 293 advisers who are no longer eligible for SEC registration because they manage less than $100 million or have failed to comply with other SEC requirements.

Norway takes action against closet-tracking

Madison Marriage   Author alerts ⌄

The Norwegian regulator has become the first in Europe to accuse a bank of mis-selling a "closet tracking" fund — products that charge high fees for active management but mimic an index.

The regulator has ordered DNB , Norway's largest bank by market capitalisation, to lower the pricing of one of its best-selling equity funds or "bring it in line with the characteristics of active management". DNB must also inform its investors of the regulator's decision.

NOT YOUR FATHER'S INDEX

Other firms are launching ETFs tracking their own or customized indexes, sometimes at a lower cost. While most ETFs are based on well-known indexes like those offered by Standard & Poor's and Russell Investments, more fund providers are creating their own or using ones designed by others.

WisdomTree Investments Inc, Van Eck Funds and IndexIQ use their own indexes. Other firms, including BlackRock, have filed with the U.S. Securities and Exchange Commission to introduce their own indexes.

Do-it-yourself indexing allows firms to create products where there may not be a relevant index, said Daniel Gamba, Head of iShares Americas Institutional Business at BlackRock. In some cases, this may be at lower cost, but not always.

Indexanbieter basteln eigene Indizes um Kosten senken zu können. Aufgepasst.

ETP Closures Hit 300

October 19, 2012 by Ron Rowland
Filed under Commentary, ETF Closings

ETP closure activity this week pushed the lifetime death toll to 300 and the year-to-date count to 89. Early October action from iPath, Russell, and Global X resulted in 30 delistings so far this month.

If a tree falls in the forest and no one is there to hear it, does it still make a sound? If an ETF closes and no shares are there to be redeemed, does it still need to liquidate? That second philosophical question has now been answered by two Russell ETFs. The Russell Low P/E ETF (LWPE) and Russell Small Cap

Here is the Complete List of 335 Products on ETF Deathwatch for Oc objective ETF Deathwatch Criteria.

The 21 ETPs added to ETF Deathwatch for October:

1. AdvisorShares STAR Global Buy-Write (VEGA)
2. BLDRS Asia 50 ADR (ADRA)
3. DB 3x Long 25+ Year Treasury Bond ETN (LBND)
4. DB Inverse Japanese Gov't Bond Futures ETN (JGBS)
5. Deutsche X-trackers Emerging Markets Bond Interest Hedged (EMIH)
6. Deutsche X-trackers High Yield Corporate Interest Hedged (HYIH)
7. Deutsche X-trackers Investment Grade Bond Interest Hedged (IGIH)
8. Direxion Value Line Conservative Equity (VLLV)
9. Direxion Value Line Mid-Large-Cap High Dividend (VLML)

ETF Deathwatch Criteria

The following criteria is used (since January 2011) to objectively determine the members of ETF Deathwatch each month based on the most recent month-end data:

1. Products (ETFs and ETNs) less than six months of age receive an automatic exclusion from consideration (incubation period).
2. Products with more than $25 million AUM in either of the past two months get a free pass (they will be not be added to the list and will removed if currently on the list).
3. Products will be added to ETF Deathwatch list if: Average daily dollar volume for a given month is less than $100,000 for three consecutive months -or- AUM is below $5 million for three consecutive months.
4. Products will be removed from ETF Deathwatch if: Average daily dollar volume for a given month is greater than $100,000 for three consecutive months -and- AUM is greater than $5 million for three consecutive months.

Here is the Complete List of 335 Products on ETF Deathwatch for October 2015 compiled using the objective ETF Deathwatch Criteria.

Strategieschwenk: Lyxor führt physisch replizierte ETFs ein

Der Trend, dass Anbieter von Swap-ETFs auf Druck von Investoren auch - oder verstärkt - physisch replizierte ETFs anbieten, gewinnt rasant an Bedeutung: Nachdem vor wenigen Tagen db X-trackers entsprechende Absichten äußerte, geht bei diesem Thema auch Lyxor International Asset Management in die Offensive. Am 6. und 11. Dezember werden (wie vor einiger Zeit angekündigt) vier ETFs aus der EuroMTS Macro Weighted AAA Government Index-Serie auf die physische Replikation umgestellt.

Für die Fonds ist dabei eine vollständige Nachbildung (Full Replication) vorgesehen: Jeder Fonds investiert direkt in die Staatsanleihen, die im jeweiligen EuroMTS Macro Weighted AAA Government Index enthalten sind. Auf die Sampling-Methode wird dabei verzichtet. Mit diesem Vorgehen wird die größtmögliche Korrelation zwischen der Fondsperformance und der Performance der Indizes erreicht.

Es wird keine Wertpapierleihe vorgenommen, denn der damit erreichte Performancevorteil für Investoren ist vernachlässigbar und rechtfertigt nicht die zusätzlichen Kontrahentenrisiken, die der Fonds bei einer Wertpapierleihe eingeht. Wie bereits bekanntgegeben, diversifiziert Lyxor mit den physischen ETFs sein Angebot, um Investorenbedürfnisse vollumfänglich zu bedienen. Lyxor betont zudem, dass alle Lyxor ETFs, unabhängig von ihrer Replizierungsmethode, höchste Qualitätsstandards in Bezug auf Transparenz, Effizienz (Performance und geringer Tracking-Error) und überdurchschnittliche Liquidität erfüllen.

SOURCE

25.06.2013

Lyxors neuer ETF-Chef: "Wir verzichten auf Wertpapierleihegeschäfte"

Beim Indexfondsanbieter Lyxor ETF lief in den vergangenen Jahren nicht alles rund. 2011 verlor die Tochter der französischen Großbank Société Générale den Platz des zweitgrößten europäischen ETF-Hauses hinter Marktführer iShares an die Deutsche-Bank-Tochter DB X-Trackers. Der jüngsten Blackrock-Marktstatistik zufolge kommt Lyxor gemessen am ausstehenden Volumen nur noch auf einen Marktanteil von 10,8 Prozent, der Abstand zur Deutschen Bank beläuft sich inzwischen auf fast drei Prozentpunkte.

Doch das soll sich ändern, und zuletzt war bei Lyxor ETF tatsächlich einiges in Bewegung: Die Sparte gehört innerhalb des Société-Générale-Konzerns inzwischen nicht mehr zur Investmentbank, sondern ist Teil der Vermögensverwaltung Lyxor Asset Management. Außerdem fusionierten die Franzosen im vergangenen Jahr ihr ETF-Geschäft mit der Indexing-Sparte, in der sie schon seit mehr als zehn Jahren institutionellen Kunden die physische Replikation von Finanzmarktbarometern anbieten. Lyxor ETF dagegen hatte Indizes bis vor Kurzem ausschließlich über Derivate (Swaps) abgebildet.

ETP WARNING

Warning on high-yield ETF returns

By Steve Johnson

Investors are pouring money into high-yield bond funds as they move to embrace higher risk against a backdrop of desultory yields on investment grade corporate and sovereign bonds.

But some industry figures have warned investors that returns are likely to be significantly lower than those posted by the mainstream high-yield bond indices due to high trading costs and inefficiencies in the market.

The fears are particularly acute for high-yield exchange traded funds, which have attracted net inflows of $6.6bn already this year, compared to $8.4bn in the whole of 2011, according to BlackRock.

Data from Lipper indicate that over the past five years the average high-yield ETF has undershot its index by 46 basis points a month, or 552bps a year, well above the typical management fee of 40-50bps.

High-yield mutual funds have also struggled to replicate their respective indices, underperforming by 192bps a year over the same period on average, according to Lipper, again far larger than their fees.

Industry figures blame the poor performance on high turnover and transaction costs that may be particularly problematic for ETFs.

WARNING

The World's Most Misleading ETF Names

By Ana Kostioukova | November 07, 2012

Related ETFs: EEB / FRN / GDX / KBE / GAF / XHB / XME / ARGT

Sometimes the name of an ETF doesn't mean what you'd think it does.

Be aware that most of the time, ETFs are the victims of their own underlying indexes and classification methodologies, and those details can be missed if investors aren't careful.

Let's begin with the SPDR S&P Emerging Middle East & Africa ETF (NYSEArca: GAF), which allocates 90 percent of the portfolio to South Africa. The remainder is split between Egypt and Morocco. As such, GAF pretty much lacks the Middle Eastern exposure its name advertises.

Does Asset Allocation Policy Explain
40, 90, or 100 Percent of Performance?

Roger G. Ibbotson and Paul D. Kaplan

Disagreement over the importance of asset allocation policy stems from asking different questions. We used balanced mutual fund and pension fund data to answer the three relevant questions. We found that about 90 percent of the variability in returns of a typical fund across time is explained by policy, about 40 percent of the variation of returns among funds is explained by policy, and on average about 100 percent of the return level is explained by the policy return level.

Long-Term Structural Changes

#	Master Trends		Subtrends Level I		Subtrends Level II
A	Technologischer Wandel	A.1	Beschleunigung im technologischen Fortschritt	A.1.1	Schwarmintelligenz: Neue soziale Organisationsformen
				A.1.2	Weltweit steigende Durchdringung an Informations- und Kommunikationstechnologien
				A.1.3	Web 2.0: Neue Medien erobern den Alltag
				A.1.4	Digitaler Lebensstil: Virtuelle Realität wird real (auch für virtuelle Business Welten)
				A.1.3	Transparent Society: Überwachung und Kontrolle (incl Quantifizierung des Individuums durch Self-Tracking)
		A.2	Neue Basisinnovationen	A.2.1	Graphene
				A.2.2	Bionik
		A.3	Technologische Konvergenz	A.3.1	Ambient Intelligence: Neue Schnittstellen und Oberflächen
				A.3.2	Neurowissenschaften, Künstliche Intelligenz und Robotik
				A.3.3	Biologie wird zur Leitwissenschaft (see A.2.2)
				A.3.4	IT & Nanotechnologie als zentrale Konvergenztreiber (Impulse in Feldern wie Medizin, Energie, Materialien)
				A.3.5	NBIC-Konvergenz (NBIC = Nanotech, Biotech, Infotech & Cognitive Science
B	Ökonomischer Wandel	B.1	Wissensbasierte Ökonomie	B.1.1	Bildung und Lernen als Fundament für neue, globale Wissenselite - kreative Klasse
				B.1.2	Innovation als zentraler Treiber und Wettbewerbsfaktor
				B.1.3	Fortschreitende Automatisierung (Vom Produktions- über den Service- in den Wissenssektor)
				B.1.4	Dynamisierung der Arbeit (orts- und zeitungebunden); flexible interaktive Arbeitsstrukturen
		B.2	Business Ökosysteme	B.2.1	Offene Systeme und Netzwerke: Grenzen von Branchen, Märkten und Unternehmen lösen sich auf
				B.2.2	Neue Wertschöpfungsnetze (Kundenintegration, Coopetition)
				B.2.3	Business Mashups: Schnittstellen produzieren neue Märkte
				B.2.4	New Power Brokers
C	Demographischer Wandel	C.1	Globales Bevölkerungswachstum	C.1.1	Geburtenboom in Entwicklungsländern
				C.1.2	Bevölkerungsschrumpfung im Westen
				C.1.3	Steigender Altenquotient in Industrienationen
				C.1.4	Urbanisierung / Starkes Wachstum von Megacitys / Open Source City
				C.1.5	Entwicklung angepasster Infrastrukturlösungen
				C.1.6	Neue Wohn-, Lebens- und Partizipationsformen
				C.1.7	Anwachsende Migrationsströme
		C.2	Gesundheit	C.2.1	Steigendes Gesundheitsbewusstsein und zunehmende Selbstverantwortung
				C.2.2	Health Tech - Health Style
				C.2.3	Neue Nahrungsmittel (Functional Food, Gen Food, Novel Food)
				C.2.4	Neue Konvergenzmärkte (Ernährung - Pharma - Medizin - Kosmetik)
D	Ökologischer Wandel	D.1	Green Energy	D.1.1	Energieeffizienz-Revolution
				D.1.2	Dezentrale Energieversorgung
				D.1.3	Alternative Energiequellen
		D.2	Endliches Okosystem	D.2.1	Wasserknappheit
				D.2.2	Steigende non-renewable Ressourcenknappheit
				D.2.3	Umweltschaeden durch wachsenden Rohstoffverbrauch
E	Globalisierung	E.1	Steigende Interdependenz von Volkswirtschaften	E.1.1	Integration von Welthandel und Finanzmarkt
				E.1.2	Steigende Mobilität von Individuen und Ideen
				E.1.3	Oekonomische Machtbalance verschiebt sich Richtung EM
				E.1.4	Abbau von weltweiten Schuldenbergen und Imbalances
				E.1.5	Global Champions
				E.1.6	Wachsende Mittelschicht in Entwicklungslaendern
		E.2	Weltrisikogesellschaft	E.2.1	Schwelende soziale/kulturelle Konflikte und gescheiterte Staaten
				E.2.2	Globaler Terrorismus
				E.2.3	Verbreitung von Massenvernichtungswaffen
		E.3	Globalisierter Individualismus	E.3.1	Verändertes Beziehungsgeflecht: Wenige starke, viele lose Bindungen
				E.3.2	Vom Massenmarkt zum Mikromarkt
				E.3.3	Selbstversorgung und Do-it-Yourself-Ökonomie
